

# Interface-parameter meeting #2

Jun 28, 2011

**Kentaro Somiya**

*Tokyo Inst of Technology*

# Contents

1. 中間マス温度

2. 点状散乱と輻射シールド

3. RMS

4. 高次モードとOMC

5. Parameter list (cont'd from the last time)

重要そうなものを  
先にやっつけます

# 中間マス温度

- 10K説と15K説が混在 (LCGT Documentでは10Kと書いてある)
- 10Kだと1Wの熱伝送が可能、15Kだと0.74W (まるめて1W)
- 中間マス以上が全て15Kを想定して設計されていた
- 10Kだとヒートリンクの数が増大し、現実的に厳しいby内山さん

15Kとする (熱吸収の要求値は厳しくなる)

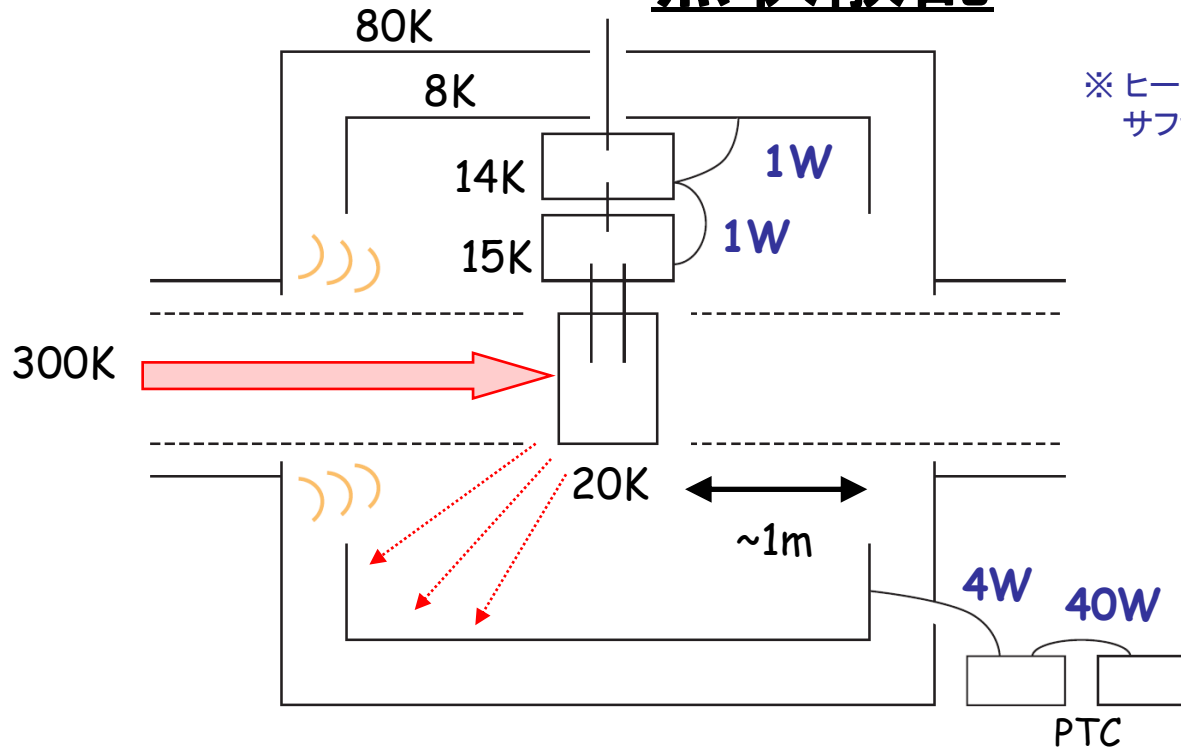

安全係数はすでに2に満たない

# 点状散乱

- 8Kの開口が狭いと点状散乱光が8Kシールドを加熱 (デフォルトでは $\phi 250$ )
- 8Kの開口が広いと80Kシールドからの熱放射が増大
- 光吸収が0.44W、15Kの中間マスへの熱伝送が0.74W→残り300mW
- 300Kの熱放射吸収は $28.7\text{mW} \times 2 \times 0.05 = 3\text{mW}$ 程度 (バツフルby榊原)

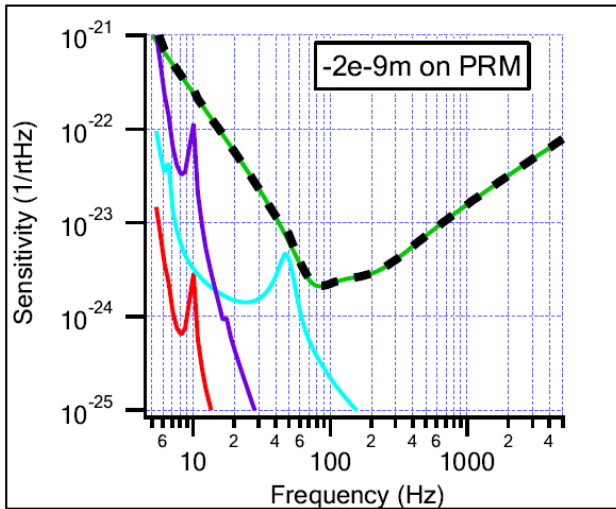

# 点状散乱

※ ヒートリンクの熱伝導率は8K付近でピーク  
 サファイアファイバーは30K付近でピークを示す

- 開口からの入熱 =  $0.05 \times 80^4 \times (R-0.125)^2 \times 3.14 \times 5.67e-8$   
 $\sim 0.365 \times R^2$  [W] → 吸熱 =  $0.0182 \times R^2$  [W]
  - 1ppmの点状散乱から8Kシールドへの入熱  
 $= 400kW \times 1ppm \times [1 - \text{atan}(R-0.125)^2] / [3.14/2]^2$   
 $\sim 0.162 \times (1-R^2)$  [W]
- ※ 8Wの入熱でIM温度が3度上昇する by 木村さん

# RMS

OMC

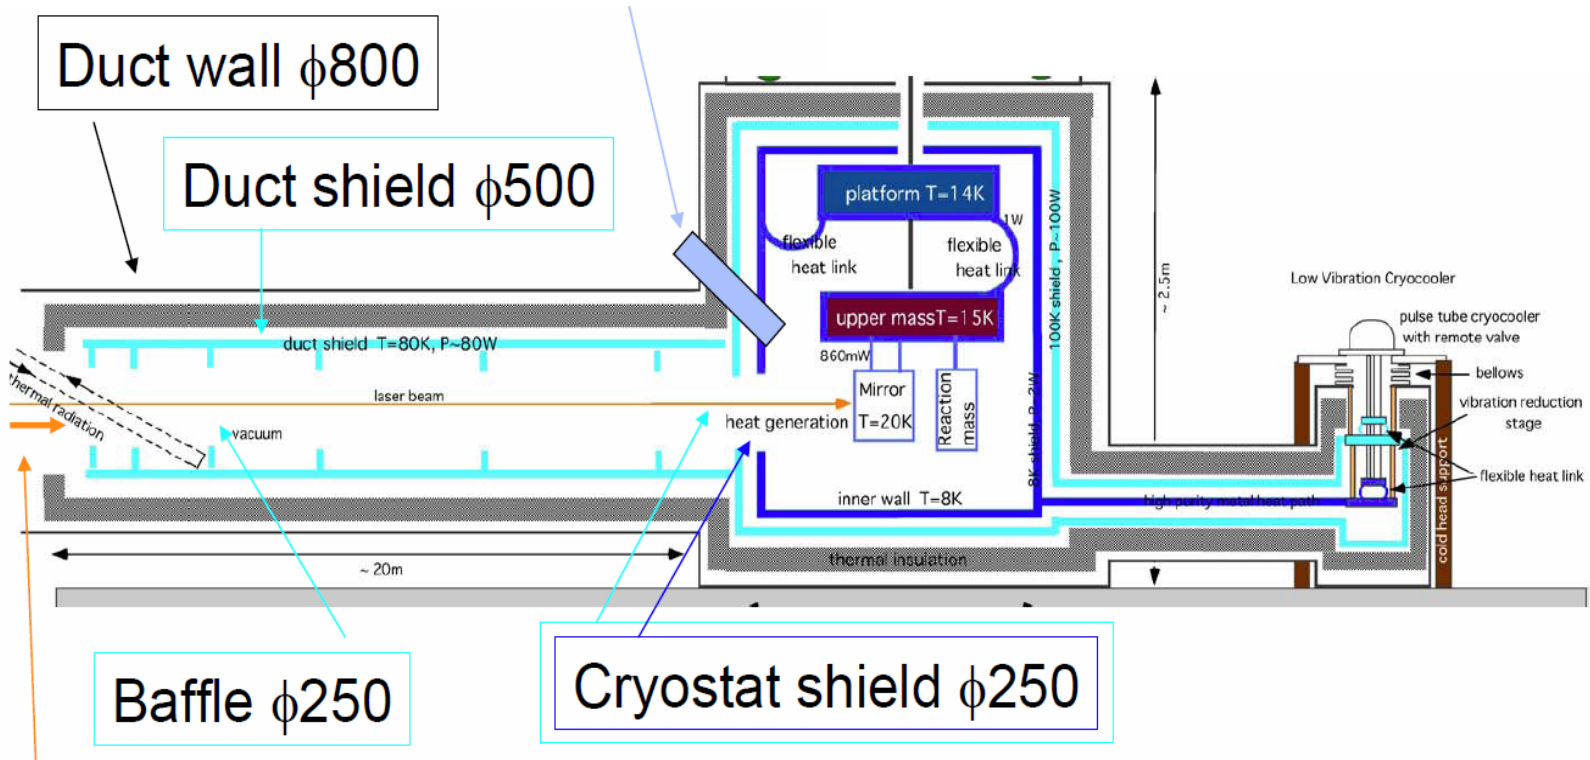

間に合いませんでした。

# インフラ

Facility	tunnel width/height	4m	TU	FA	VA		
Facility	tunnel tilt	1/300	TU	FA	VA		IF
