

# Status Report

-Rishabh Bajpai

# Fibers

- Need to measure two fibers.
- Will measure KAGRA size fiber first.
- The clamping style is using a cone with Cu plate on top.
- **Designed a setup which can measure both fibers.**

# Setup

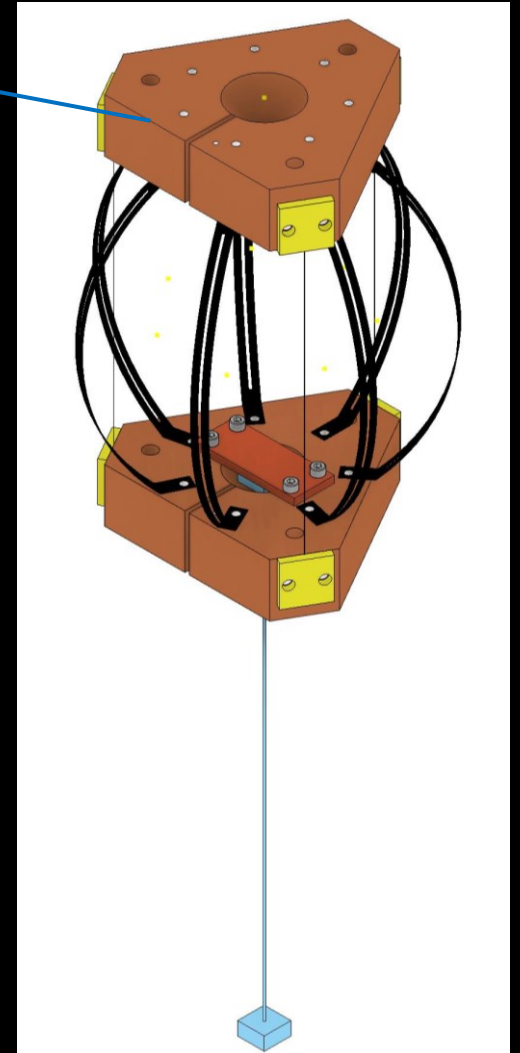

Same as bottom one. The other side has smaller countersink for smaller fiber

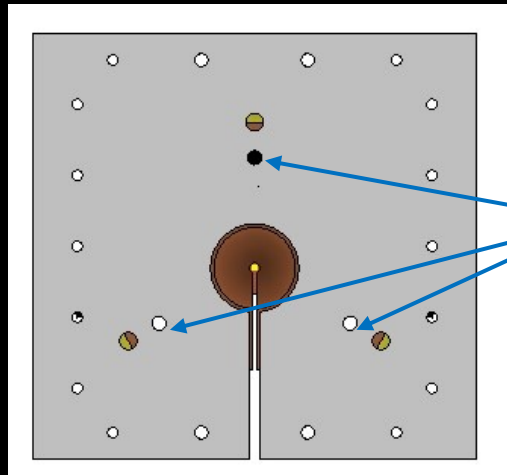

Countersunk (cone) for point contact with copper plate for clamping.

Tungsten Wire :  $\Phi$  0.15 mm  
Safety factor: 3.4  
Length= 200 mm

Heat-link: Al sheet  
0.5 mm thick at KEK?

# Setup

Triangle-1 bolted to square plate with 3 M8 bolts from bottom

Square plate supported by 4 plates and also bolted by 4 M5/6 screws to frame. The square plate can be moved up/down.

For small fiber

- The bottom plate can be used as earthquake stopper and to catch the fiber.
- It can also be used to lock suspended triangle to remove fiber and rotate the frame to measure smaller fiber.

KAGRA size fiber

# Setup-Cryostat

- Fiber is slightly above viewport axis.
- Increase the wire length or reduce frame height.

- Can bring the fiber lower by 50-55 mm.
- Other option is to use steering mirror.

# Current Status

- Left the TMP running during LVK.
- Current pressure is:
  - $8.26 \times 10^{-6}$  mBar
- Skip leak test for now.

# Stopper

# Reduced Frame Height

- Can bring the base of fiber down by 50-55 mm. By increasing tungsten wire length or reducing frame height.
- Other option is to use steering mirror.

**Base of Sapphire Fiber**  
**Center of Viewports**

# Timeline

By	Task
September 30	Submit drawing to machining center (1-month)
October 31	Preparation for calibration cooling
November 30	Assemble setup and start calibration cooling
December 31	Start measurement of KAGRA size fiber

# Future Work

- Make minor changes to the design to align with view port and consider location of electrostatic actuator.
- Prepare the drawings to submit to KEK machining center.
- Prepare Labview Vi and fix troubles with vacuum gauges.
- Connect buffer tank, rotary valve and temperature sensor.
- Move items from ICRR. Maybe next week.
- Deadline for TAUP proceedings (4 pages at most) is Nov. 15. I will circulate it to the co-authors when it is complete. **Do I need CPC approval?**
